End-User Development Jun 20 2021 Work practices and organizational processes vary widely and evolve constantly. The technology infrastructure has to follow, allowing or even supporting these changes. Traditional approaches to software engineering reach their limits whenever the full spectrum of user requirements cannot be anticipated or the frequency of changes makes software development cycles too clumsy to address all the needs of a specific field of application. Moreover, the increasing importance of 'infrastructure' aspects, particularly the mutual dependencies between technologies, usages, and domain competencies, calls for a differentiation of roles beyond the classical user-designer dichotomy. End user development (EUD) addresses these issues by offering lightweight, time support which allows users to configure, adapt, and evolve their software by themselves. EUD is understood as a set of techniques, and tools that allow users of software systems who are acting as non-professional software developers to create, extend a software artifact. While programming activities by non-professional actors are an essential focus, EUD also investigates related activities such as collective understanding and sense-making of use problems and solutions, the interaction among end users with regard to the introduction and diffusion of new configurations, or delegation patterns that may also partly involve professional designers.

Demanding Energy Jun 01 2022 This edited collection critically engages with an important but rarely-asked question: what is energy for? This starting point foregrounds the diverse social processes implicated in the making of energy demand and how these processes have over time to shape the past patterns, present dynamics and future trajectories of energy use. Through a series of innovative case studies, the book explores how energy demand is embedded in shared practices and activities within society, such as going to music festivals, cooking food, travelling for business or leisure and working in hospitals. Demanding Energy investigates the dynamics of energy demand in organisations and everyday life, and demonstrates how an understanding of spatiality and temporality is crucial for understanding the relationship between energy demand and everyday practices. This collection will be of interest to researchers and students in fields of energy, climate change, transport, sustainability and sociologies and geographies of consumption and environment. 10 of 15 of this book are available open access under a CC BY 4.0 license at link.springer.com
