Manual of Temporal Bone Dissection Nov 02 2020 The temporal bone is an anatomical jewel box of extraordinary complexity. Both the minuscule scale of its vital structures and their convoluted three-dimensional relationships make microsurgery of this region one of the most technically demanding of all operative endeavours. Unravelling the mysteries of temporal bone anatomy is the foremost challenge faced by every otologist. The goal of achieving perfect knowledge and facility will never be achieved. No matter how experienced a surgeon becomes, ongoing study of the finer points of temporal bone anatomy (observed both in the operating room and dissection laboratory) serves to maintain and improve his or her skill. Dr Barbara has produced a highly useful *Manual of Temporal Bone Dissection* to guide exploration of the temporal bone. Its stepwise approach will prove useful for both the novice otologist and the experienced surgeon seeking to refresh his or her knowledge. Its orientation upon specific surgical procedures, rather than pure anatomy, enhances its utility for the practising surgeon. This written resource is an essential element of the three components needed for a high quality surgical dissection course: a lucid manual (such as that authored by Dr Barbara), informative didactic sessions, and anatomical dissection proctored by expert microsurgeons. The team at 'La Sapienza' are to be congratulated for their efforts in producing an outstanding educational programme.

Guide to the Dissection of the Dog Aug 31 2020 This manual represents an experiment both as to choice of animal and plan of work. The dog has been chosen as subject of dissection instead of a large herbivore for several reasons. The student-specimen ratio can be reduced with a resultant increase in time for dissection by the individual student. At the same time more material can be covered in a given period than by using the horse or ox owing to the smaller size of the specimen and the ease with which structures are cleaned and visualized. These and other advantages result not only in better preparation of a student to study the more economically important animals, but also increases the time that can be devoted to the study of those regions most often involved surgically. The dog is cheaply purchased, preserved and prepared for dissection. After the arteries are filled with red latex they stand out more vividly than in life. The large systemic veins can also be injected. A large part of a dissected dog can be seen in a single field of vision. Structures can be left in place, e.g., the heart is dissected without removing it from the thorax. Terms used in veterinary anatomy are largely taken from human anatomy. Since in the dog structures closely resemble those of man, an advantage in making homologies to the mutual benefit of teacher and student results. In general all terms have been Anglicized except most names of muscles, and even these Latin names have been used as if they were English in some places. The Latin terms were retained to differentiate muscles from nerves and vessels; furthermore most veterinarians prefer to use them. The improved BNA or INA terminology has been used almost entirely. Needless to say the excellent texts of Ellenberger and Baum, and Sisson and Grossman have been used frequently as references. It is probable that both have influenced the terminology more than they should, since a uniform terminology is desired by all anatomists.
