emphasizing a multi-disciplinary approach. The first chapter of the book provides an overview of this complex disease process and discusses the teamwork required for optimal management. The chapters continue with the basic pathophysiology of diabetic atherosclerosis and a contemporary review of the management of diabetes. The genesis of diabetic foot ulceration and prevention and management strategies is covered, as is the effects of neuropathy and microvascular changes in the diabetic foot. In addition, Diabetes and Peripheral

Vascular Disease covers the microbiology of diabetic foot infections, the role of endovascular interventions and vascular surgery as well as the management of the complications of these procedures, the process of amputation for those patients who have progressed beyond a limb salvage situation, and the effects of diabetes on the cerebrovascular system as well as its implications in patients with aortoiliac disease. An invaluable addition to the literature on diabetes and peripheral vascular disease, the book will be of great interest internists, family practitioners,

surgeons, podiatrists, wound care specialists, and vascular specialists. Students, residents, and fellows in surgical and medical specialties should also find this book of significant value and interest.

Induced Mutations in Plant Breeding
Nov 19 2021
Mutation breeding has been introduced into modern plant breeding in the early 1940's. In spite of pessimistic predictions, the application of experimental mutagenesis has led to encouraging results demonstrating that mutation breeding is a well-functioning method in many crops. So far, more than 500 varieties, developed by means of induced mutations, have been officially released; others have been approved for registration. Many mutants with characters of agronomic interest cannot be utilized directly because of

their unsatisfying yielding capacities, or of other negative traits which are partly due to the pleiotropic action of the mutant genes. Sometimes their negative selection value can be overcome by transferring them into the genomes of other varieties. According to experience available, the efficiency of mutant genes can considerably vary depending on the genotypic background in which they become effective. The interactions between mutant genes and genotypic background cannot be predicted. Therefore, mutants with valuable traits should be crossed.

with many varieties and strains in order to discern positive and negative interactions. In this way, genotypes can be selected in which the mutant gene is able to express its action without showing negative by-effects. This procedure has been used for about 10 years by combining the methods of mutation and crossbreeding. Mutation breeding is predominantly used in annual diploid and allo polyploid self-fertilizing crops, while it causes much more difficulties in cross-pollinating species.

Application of Mutation Breeding Methods in the Improvement of Vegetatively Propagated Crops: An Interpretive Literature Review

summarizes advances in the use of artificially induced mutations to improve cultivated plants, particularly those that are vegetatively propagated. It brings together all available and accessible references that examine the advantages, drawbacks, and possibilities of the mutation breeding method, as well as the challenges that prevent it from being applied to various crops. Comprised of eight chapters, this volume begins with an overview of various aspects of mutagenic treatment using chemical and physical mutagens. It then discusses

the structure and functioning of shoot apices and their behavior after irradiation; adventitious bud techniques and other in vivo or in vitro methods of asexual propagation; and breeding of root and tuber crops, such as cassava and potato, ornamental crops such as foliage plants and cut flowers, fruit crops, and other crops. Plant breeders who want to better understand how to apply mutation breeding to their crops will find this book extremely helpful.

Applied Mutation Breeding for Vegetatively Propagated Crops

Oct 31 2022 When the first edition of this book appeared in 1978, it was warmly received. Most readers and reviewers especially valued the extensive coverage of the literature in the chapters dealing with the different crops. ``... a valuable and timely addition to plant breeders and of outstanding value to breeders of ornamental plants. The book's special strength resides in the extensive review of literature ..." (International Journal for Breeding Research). This is also reflected by the many times that

the work has been referred to in other publications. This new edition provides plant breeders as well as scientists with an up-to-date overview of methods and results of the application of mutation breeding in order to genetically improve vegetatively propagated crops. General principles and background information about mutation breeding in general, methods of treatment, material to be treated and results are discussed in the introductory chapters, followed by a description of the specific situation in each of the vegetatively propagated crops ever used in a mutation breeding

project. This volume brings together all the important and relevant literature in the field. It provides a complete account of mutation breeding of vegetatively produced crops, presenting conclusions about the value of the method, its possibilities, limitations and shortcomings and the possible difficulties of further application in various crops. The initial chapters deal with the interactions between mutagenic treatment and plant material, such as aspects of mutagenic treatment, post-irradiation behaviour of shoot apices and

adventitious bud techniques. All available literature is then discussed crop by crop and critically evaluated. Almost 1700 references are covered and whenever possible suggestions for more efficient application of mutation breeding methods are given.

Crops I Aug 29 2022 Production of food to meet the demands of an ever-increasing human population in the world is the major task and challenge to agriculture today. The conventional methods of plant breeding alone can no longer cope with the situation. The success of any crop improvement program depends on the extent of genetic variability in the base population, but due to denuding of forests and agricultural land, the naturally occurring pool of

germplasm is being depleted. An urgent need is therefore apparent to create new variability and increase the genetic base of agricultural crops. Agricultural biotechnology has progressed to a stage in the production of plants where specific characteristics to improve their yield, appearance, disease-resistance, nutritional quality and adaptation to adverse soil conditions can be built into the seed. This concept of built-in quality implies a continuous scientific endeavour to improve plant characters using a wide range of possibilities, and it also implies a scrutiny of the

materials and methods available in the world today.

Crop Breeding: A Contemporary Basis Jun 26 2022
