Everyday Physics Nov 24 2021 Excerpt from *Everyday Physics: A Laboratory Manual* The beginner in science must be guided carefully in his early experiments if he is to develop habits of careful observation, clear thinking, and orderly presentation of results. The exercises in this manual have been carefully designed and the instructions definitely stated, in order that the pupil may see clearly the end in view and the method of procedure, with the least possible amount of assistance on the part of the instructor in charge. On the other hand, the pupil must be given a chance to think for himself if he is ever to develop a scientific imagination or to acquire initiative. Under the head of Topics for Further Study and Investigation, hints, topics, and suggestions have been freely given for the development of projects in connection with which the pupil is expected, of his own initiative, to gather information from trade catalogues and textbooks, from practical men at work in his vicinity, or from observations at home, and to draw his own conclusions and report the results. A practical exercise offered under this head may often be substituted with profit for a more formal exercise outlined in the body of the text.' Special credit should be given in each case for this part of the work, and the pupil should be encouraged to make this department an important feature of his course. Nearly every exercise is preceded by an Introduction, intended to show the bearing of the topic in hand upon related subjects or to make the object of the exercise a little more definite, and is followed, usually, by a few carefully framed questions or problems emphasizing the immediate application of the principle involved to the affairs of daily life. Laboratory Projects in Physics Jun 07 2020 Excerpt from *Laboratory Projects in Physics: A Manual of Practical Experiments for Beginners* These experiments have been organized for the purpose of giving concrete expression, in the field of physics, to the recent tendencies in the teaching of science with respect to aim, subject matter, and method. The physics course in a modern high school should be organized according to the recognized function of education in a democratic society. It should include units of study which the masses of boys and girls of high school age are able to pursue with profit. It should proceed toward an organization of practical situations, activities, and phenomena, the value of which will be recognized and approved by teachers, students, parents, administrators of education, and others who are responsible for the work which boys and

girls do in the high school. It is intended that these experiments should form part of a physics course which includes class discussions and demonstrations. They were devised and used for several years in a beginners' course in practical physics. They differ from the conventional physics laboratory experiments in that they deal more directly with the mechanisms and appliances of everyday experience. The materials and procedure have been worked out in detail in order to aid the busy science teacher in the laborious task of placing practical laboratory study upon a workable basis. A large list of projects and problems is offered. In a year's course of thirty-six to forty weeks perhaps not more than half of the ninety-five experiments can be performed. The complete list represents two years' work unless more time is assigned to laboratory study than is the custom.
