Deciding to Forego Life-sustaining Treatment Jun 11 2021 Abstract: A comprehensive report by the US President's Commission for the Study of Ethical Problems in Medicine and Biomedical and Behavioral Research addresses some of the most important and troubling ethical and legal questions in modern medicine for consideration by health care professionals, lawyers, and relatives of patients regarding the sensitive topic of voluntary cessation of life-sustaining therapy for the seriously ill. It was concluded that the cases that involve true ethical difficulties are much fewer than commonly believed and that the perception of difficulties primarily occurs because of misunderstandings about the dictates of law and ethics. It also is concluded that, while competent informed patients have the authority to decline or accept health care, others must act on the behalf of incompetent patients. The report urges that health care institutions develop and use internal review methods that permit exploration of all relevant issues. The 7 report chapters are grouped around 2 themes: the various aspects of making treatment decisions; and patient groups raising special concerns (e.g.: permanently-unconscious patients; seriously-ill newborns. Flight Physics Jan 18 2022 Knowledge is not merely everything we have come to know, but also ideas we have pondered long enough to know in which way they are related, and how these ideas can be put to practical use. Modern aviation has been made possible as a result of much scientific research. However, the very first useful results of this research became available a considerable length of time after the aviation pioneers had made their first flights. Apparently, researchers were not able to find an adequate explanation for the occurrence of lift until the beginning of the 21st century. Also, for the fundamentals of stability and control, there was no theory available that the pioneers could rely on. Only after the first motorized flights had been successfully made did researchers become more interested in the science of aviation, which from then on began to take shape. In modern day life, many millions of passengers are transported every year by air. People in the western societies take to the skies, on average, several times a year. Especially in areas surrounding busy airports, travel by plane has been on the rise since the end of the Second World War. Despite becoming familiar with the sight of a jumbo jet commencing its flight once or twice a day, many find it astonishing that such a colossus with a mass of several hundred thousands of kilograms can actually lift off from the ground.

Prevention of Hazardous Fires and Explosions Apr 09 2021 Besides its obvious destructive potential, military R&D also serves to protect human lives, equipment and facilities against the effects of weapons. Concepts have therefore been developed that improve safety of stationary and mobile facilities against pressure waves, thermal radiation and fire. Effective, fast fire extinguishing equipment has been designed for tank compartments and motors. Closed buildings are demolished and landmines are removed with gas and dust explosions. Stringent safety requirements have been developed for the production of ammunition and explosives. Military and related industries have accumulated a vast knowledge and sophisticated experience that are very valuable in a variety of civil applications. The knowledge is based on theoretical and experimental research work, the origin of which sometimes dates back many centuries. It has often been classified and therefore has remained unknown to the civilian population, until now.
